Bringing news and service details to you every quarter.

Providing Excellent Nursing Care and Cost Savings

Preferred Medical Network will handle all the coordination of your patients' care while working side by side with insurance adjusters, nurse case managers and discharge planners. PMN will contact hospitals and physicians for orders and prescriptions, streamlining the process of arranging services for the injured worker. This allows adjusters and nurse case managers more time to manage treatment during the entire rehabilitation process. Cost savings summaries verifying the services and the discounted rates will be provided to the adjusters and nurse case managers via fax or email.

As your PREFERRED provider we look forward to serving your patients' needs throughout their rehabilitation process.

In-home nursing also has many advantages over hospital care:

1. Psychological studies show that patients can heal more quickly in their own environment as opposed to a hospital or rehab facility.
2. Costs savings are achieved as the nurse and medication are being paid for rather than a daily hospital charge.
3. In-home physical and occupational therapy can lessen the length of time spent in a rehab facility, allowing the patient to spend more time at home and saving significant facility charges.
4. Some doctor office charges – such as removing staples, inserting pic lines or wound dressing changes – can be avoided.
5. There is no need to provide transportation or mileage reimbursement to patients.

When it comes to nursing services, you want your clients to experience the best care. Preferred Medical Network provides quality care through qualified healthcare professionals for the services listed at right. These services can be provided both locally and throughout the United States.

Preferred Medical Network will increase cost savings significantly with our management services and contracted rates. Call us today for more information.

Physical therapy

Occupational therapy

Social services

Speech therapy

Home health aids

Did you know...

that the FDA approved the first bone stimulator in 1994? Bone stimulators generate an electrical field similar to the one produced naturally around a fracture. This low-level electrical field activates the body's internal repair mechanism, which in turn stimulates bone healing.

External or internal stimulators are often used for nonunion bone fractures (injury or congenital), failed bone fusion and other medically-necessary conditions, for example certain grades of vertebrae fractures with individuals having additional risk factors such as smoking or obesity.

Preferred Medical Network can provide a range of bone growth stimulator products, including Orthofix brand®, at substantially reduced pricing. Contact us to find out what kind of savings you can experience with our assistance.
